Introduction: The Costs of Corruption

Poverty, poor health, low life expectancy, and an unequal distribution of income and wealth are endemic throughout the world. Many countries have very low or negative growth rates. Even some countries that are well endowed with natural resources have poor growth records and low per capita incomes. Others, especially in the former Soviet bloc, have weak economic records in spite of a well-educated labor force.

Yet a paradox exists. International lending organizations, such as the World Bank, often have difficulty locating acceptable projects. How can this be so when the need is obviously so great? One root of the problem is dysfunctional public and private institutions. Poorly functioning governments mean that outside assistance will not be used effectively. Low-income countries and those with weak growth records are often in difficulty because they are unable to use their human and material resources effectively. They need institutional reform, but such reform is difficult. Constructing dams, highways, and port facilities is technically straightforward. Reforming government and nurturing a strong private sector are more subtle and difficult tasks that cannot be reduced to an engineering blueprint.

The tension between the capacities of developing countries and the requirements of international aid and lending organizations arises from

¹ Phillip Keefer and Stephen Knack (1995) examine the impact of government institutions on investment and growth for 97 countries over the period 1974 to 1989. Their measure of government quality combines indices of corruption, expropriation risk, rule of law, risk of contract repudiation by the government, and the quality of the bureaucracy. The authors show that measures of the quality of government institutions do at least as well as in explaining investment and growth as measures of political freedoms, civil liberties, and the frequency of political violence.

Other critics question the goals of the international community, arguing that economic growth is a narrow and incomplete measure of well-being. But even accepting that criticism, wide differences remain across and within countries in health, education, economic opportunity, and environmental quality. Whatever seems universally valuable – be it higher per capita income, longer life expectancy, or reduced infant mortality – varies widely around the world and is rising and falling at different rates.

Obviously, subtle differences in culture and basic values exist across the world. But there is one human motivator that is both universal and central to explaining the divergent experiences of different countries. That motivator is self-interest, including an interest in the well-being of one's family and peer group. Critics call it greed. Economists call it utility maximization. Whatever the label, societies differ in the way they channel self-interest. Endemic corruption suggests a pervasive failure to tap self-interest for productive purposes.

We can go a good way toward understanding development failures by understanding how self-interest is managed or mismanaged. The best case is provided by the archetypal competitive market where self-interest is transmuted into productive activities that lead to efficient resource use. The worst case is war – a destructive struggle over wealth that ends up destroying the resource base that motivated the fight in the first place. In between are situations where people use resources both for productive purposes and to gain an advantage in dividing up the benefits of economic activity – called "rent seeking" by economists (Bhagwati 1974; Krueger 1974).

I explore the interaction between productive economic activity and unproductive rent seeking by focusing on the universal phenomenon of corruption in the public sector. In recent studies, high levels of corruption are associated with lower levels of investment and growth. Corruption reduces the effectiveness of industrial policies and encourages business to operate in the unofficial sector in violation of tax and regulatory laws.² Foreign direct investment (FDI) is discouraged by

high corruption levels. Asian economies are not an exception – those with high corruption levels would have attracted more FDI if corruption had been lower, and their industrial policies would have been more effective.³

Even when corruption and economic growth coexist, payoffs introduce costs and distortions. Corrupt high-level officials support too much unproductive public investment and under-maintain past investments. Corruption reduces total investment and limits FDI, but it encourages excessive public infrastructure investment (Tanzi and Davoodi 1997). In a corrupt regime, economic actors with few scruples, such as those engaged in illegal businesses, have a comparative advantage. A country is poorer overall if corruption levels are high. It may be caught in a corruption trap where corruption breeds more corruption and discourages legitimate business investment.

Cross-country empirical work has confirmed the negative impact of corruption on growth and productivity, but it is of little use in designing anticorruption strategies. The research shows that corruption is harmful but does not identify the precise mechanisms by which corruption affects

(GDP). The corruption indices are highly correlated with other measures of bureaucratic efficiency, such as the level of red tape and the quality of the judiciary. As a consequence, Mauro was unable to measure the marginal effect of any one of these measures. Putting the separate indices together in a measure of bureaucratic efficiency (that ranges from one to ten), "if Bangladesh [with a score of 4.7] were to improve the integrity and efficiency of its bureaucracy to the level of that of Uruguay [score 6.8]...its investment rate would rise by almost five percentage points and its yearly GDP growth rate would rise by over half a percentage point" (Mauro 1995: 705). Mauro also demonstrates that highly corrupt countries tend to underinvest in human capital by spending less on education (Mauro 1998). He argues that this occurs because education provides less lucrative corruption opportunities than other types of more capital-intensive public spending.

Alberto Ades and Rafael di Tella (1997a) argue that an aggressive industrial policy may be partly motivated by the corrupt gains the policy makes available. In such cases, the direct positive effect of the policy can be undermined by its role in increasing corruption and, hence, discouraging investment. Their empirical results demonstrate that in the presence of corruption, the positive impact of industrial policy is halved. East Asian economies are not immune from this effect. Simon Johnson, Daniel Kaufmann, and Pablo Zoido-Lobatón (1998: 389–391) find that higher levels of corruption are associated with a larger unofficial economy.

³ Shang-Jin Wei (1997) shows that corruption acts like a tax on FDI. An increase in the corruption level from relatively clean Singapore to relatively corrupt Mexico is the equivalent of an increase in the tax rate of over 20 percentage points. The statistical result holds for East Asian countries as well as for the others in his sample.

economic performance. In fact, it is not even clear what it means for a country to rank highly on a corruption index. Does it mean that bribes are a large share of the value of contracts and government services? Does it mean that the proportion of deals influenced by bribery is high? Does it mean that bribery has an especially distortionary impact on economic and political life? The surveys give no information that would help one understand their underlying meaning, and in fact, such information does not appear to exist. Further complicating matters, the correlation between corruption and poor economic performance is not absolute. High levels of corruption are more destructive under some conditions than others (Wedeman 1997: 459).

The level of bribes is not the critical variable. One wants to know not just how much was paid, but also what was purchased with the payoff. For that, one needs detailed country-by-country and sector-by-sector analyses. This book is an attempt to set the agenda for such efforts and to draw lessons from the work that already exists. Only if one looks at the fine structure of political and economic systems can one go beyond a showing that corruption is harmful to an understanding of the way it operates in different contexts. Given that knowledge, reform programs can attack corruption where it has the worst effects. I draw on existing work in individual countries to illustrate my arguments concerning the causes and consequences of corruption and to recommend reforms. However, the existing collection of cases is not sufficient. We need more systematic knowledge of just how corruption and self-dealing affect the operation of government programs and private markets.

I analyze the problem of corruption along four dimensions. The first takes the background organization of state and society as given and asks how corrupt incentives arise within public programs. I show that corruption can create inefficiencies and inequities and is, at best, inferior to legally established payment schemes. Reforms can reduce the incentives for bribery and increase the risks of corruption. The goal is not the elimination of corruption but an improvement in the overall efficiency, fairness, and legitimacy of the state. The total elimination of corruption will never be worthwhile, but steps can be taken to limit its reach and reduce the harms it causes.

⁴ As an example of the kind of detailed understanding needed for concrete proposals in particular cases, consider Judith Tendler's 1979 report to the World Bank on graft in rural works programs in Bangladesh. The paper is an admirable analysis of the impact of graft on different aspects of a development project and a discussion of the conditions under which local people can be used as monitors of others' honesty.

nderstanding needed for concrete proth Tendler's 1979 report to the World Bangladesh. The paper is an admirable it aspects of a development project and h local people can be used as monitors The second recognizes that corruption has different meanings in different societies. One person's bribe is another person's gift. A political leader or public official who aids friends, family members, and supporters may seem praiseworthy in some societies and corrupt in others. My aim is not to set a universal standard for where to draw the legal line between praiseworthy gifts and illegal and unethical bribes. It will be enough to isolate the factors that should go into the choice. Culture and history are explanations, not excuses. As an economist, I cannot provide an in-depth analysis of the role of culture and history, but I can point out when the legacy of the past no longer fits modern conditions.

The third approach considers how the basic structure of the public and private sectors produces or suppresses corruption. I consider the relationship between corrupt incentives and democratic forms and discuss the relative bargaining power of public and private organizations and individual actors. Reform at this level may well require changes in both constitutional structures and the underlying relationship between the market and the state.

The final section of the book considers the difficult issue of achieving reform. First, I discuss the role of the international community, both aid and lending organizations, and multinational economic and political bodies. For some countries, especially those at low levels of development, the role of multinational businesses is critical. If these firms collaborate in maintaining corrupt regimes, they undermine development goals. I assess recent efforts to enlist business in helping limit corruption in developing countries and in those making a transition from socialism.

Second, proposals for reform lead to the problem of domestic political will. Good ideas are useless unless someone is willing to implement them. The book concludes with lessons drawn from successful and sustainable policies carried out in the past. Although no two countries face the same set of background conditions, modern-day reformers can learn something from the historical record.

This book does not present a blueprint for reform; it does not end with a compilation of "best practices." Instead, it suggests a range of alternatives that reformers must tailor to the conditions in individual countries. There is one fundamental lesson, however. Reform should not be limited to the creation of "integrity systems." Instead, fundamental changes in the way government does business ought to be at the heart of the reform agenda. The primary goal should be to reduce the underlying incentives to pay and receive bribes, not to tighten systems of ex post control.

Enforcement and monitoring are needed, but they will have little long-term impact if the basic conditions that encourage payoffs are not reduced. If these incentives remain, the elimination of one set of "bad apples" will soon lead to the creation of a new group of corrupt officials and private bribe payers.
